System Failure

SNAP Application Delays

Families across Arizona face **unacceptable delays** in SNAP application processing, with many waiting at food banks for essential support that should be readily available.

Stream Line Broken Systems

The current Food Bank model is archaic and does note allow for impact where is needed when it is needed. The systems are clunky and have not adapted to the needs of 2026 and beyond.

SNAP Application Delays in Arizona

+ “X” x 50 additional states

Pending Applications

Average State Example: Over **50,000 applications** are currently pending, highlighting significant delays in the SNAP processing system across Arizona.

Exceeding Requirements

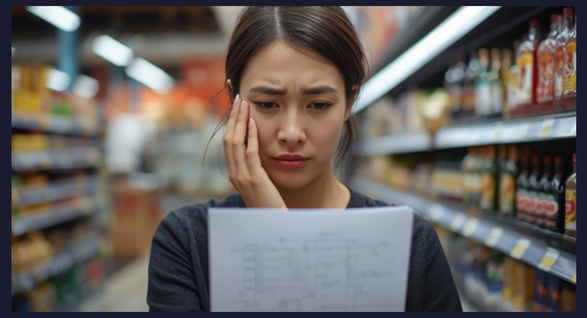

Average State Example: More than **18,000 applications** have surpassed the federal 30-day requirement, leading to urgent food access challenges for families.

Average SNAP Approval time ~8 months
Delays in processing applications highlight that the real challenge lies in timing rather than falsely attributing delay to resource availability.

Insert “Feed A Friend” 503c3

Micro Philanthropy at its best. Removing all the white-washing in between in archacic food distribution systems.
Average time soultion time 72 hours or less

Understanding the Gap in Assistance Systems

Approval-Based

Systems require lengthy approvals before assistance is provided. (Systemic breakdown, archacic, broken tech)

Immediate Needs

Households require assistance without unnecessary delays or barriers.

Unaddressed Interval

There is a critical gap in timely food access for humans and “tails”.

The Intervention Model

AI-Driven

An **AI-driven decision engine** assesses the urgency of food needs, allocating resources efficiently to ensure timely delivery and support for families in crisis situations BEFORE SNAP kicks in.

Infrastructure

Built on existing logistics networks.

Micro-Financing

Supports $300 intervention units effectively.

Intervention Model

Cost-Effective Solutions

Food Distribution Network

This illustration represents the structured network facilitating food distribution to meet community needs effectively.

Community Support System

The image illustrates essential support services, showcasing the community's role in providing timely food assistance.

AI-Driven Logistics

This illustration highlights the integration of AI technology in optimizing food distribution for greater impact and efficiency.

Expanded Impact Model

Human Stability

Ensures **immediate food access** during assistance delays, promoting overall household well-being and stability.

Pet Retention

Reduces **financially driven pet surrender**, keeping pets with their families and alleviating shelter burdens.

Animal Welfare

Redistributes pet food to shelters and rescues, supporting underfunded nonprofit networks in the community.

Environmental Insights

Monitors wildlife distress patterns and shares data with partners to proactively address ecological challenges.

Family Stability

Ensuring food access enhances household well-being

Community Support

Volunteers bridging gaps in logistics in filling carts and food access

Pet Welfare

Reducing pet surrender through food access

Environmental Health

Monitoring wildlife for ecosystem stability

Data Intelligence

Utilizing AI for resource allocation

Five Key Inital Impact Areas

AI and Data Insights

Application Tracking

Monitors wait times for SNAP applications across various regions.

Demand Patterns

Identifies trends in unmet food and resource needs effectively.

Geographic Analysis

Maps the distribution of need for targeted resource allocation.

Resource Gaps

Assesses differences between food, pet food, and prescription needs.

Data Collection

Generates anonymized datasets for informed decision-making and reporting.

Performance Index

Produces a national Assistance Delay Index indicating systemic delays.

Economic Efficiency in Resource Allocation

Transparent Micro Philanthropy:
Experiential Impact x
Collaboration x
AI x
Community of Solvers x
Data Managment X
ESG and Clarity
Impact Investing Tech

No Warehousing

Efficient systems avoid unnecessary storage costs and delays shuffling around over stock product

No Overhead

Streamlined operations minimize additional financial burdens on resources.

Existing Supply Chains

Leveraging current networks maximizes resource deployment efficiency.
Less food wasted. Solves for “Now Need”

Corporate and Philanthropic Advantages

Logistics

Increased utilization of existing infrastructure reduces costs.

Scalability

A data-driven intervention model enhances impact significantly.

System-Level Impact

Infrastructure changes yield lasting benefits for communities.

Launch Capital

INTITAL GOALS

TOTAL NEEDED: $2M - $5M (Philanthropic donations + corporate partnerships + government contracts)
Essential Investment:

- 4-6 Month Arizona Pilot ($1.8M-$2.9M): Complete AI platform, hire core team (3-5 FTE), serve 3,000-5,000 households at $300 each ($200 food + $100 pet supplies), establish corporate partnerships
- Year 2 Multi-State Scale ($3.1M-$5.1M): Expand to 5-10 states, grow to 8-12 staff, serve 10,000-15,000 households, develop corporate ESG portals and government contract capabilities
- Revenue Model (At Scale): Corporate cash donations ($10M-50M/year) + gift cards ($20M-100M/year) + government contracts ($5M-10M/year) + foundation grants ($2M-5M/year)
- Operating Efficiency: 93% of budget to programs, software license $500K base + $1.50/intervention, staff costs 15-20% of budget
- Sustainability Achieved Month 18-24: Corporate partnerships + government contracts cover 100% operating costs
