MwareV Partner Connect Platform -- System Capability & Trust Card

Platform Ref	V-1 Series -- Virtualization & Cloud Orchestration . Documentation Cycle: Q3-Q4 2021
Card Version	v2.4 . Internal Release . Based on Partner Connect v2.3-v2.4
Author	E. Hannan -- Documentation Lead & Research Operations Coordinator
Source Team	Sr. Director, Engagement Marketing . Partner Enablement Engineering . Platform Security
Audience	Partner Sales Engineers . Channel Leadership . Enterprise Security Architects
Classification	Partner-Confidential -- NDA Protected . Names adapted per disclosure protocol
Related Artifacts	Partner Connect Program Guide . ASL Risk Assessment . Security Disclosure Annex
Software	MwareV Partner Connect v2.4 (GA: Q3 2021) . SAML 2.0 / OIDC . AES-256 / TLS 1.3

1. Executive Summary

MwareV Partner Connect (V-1 Series) is a multi-tier channel orchestration system enabling certified reseller, service provider, and technology partner organizations to configure, quote, and deliver virtualization solutions across private cloud, hybrid cloud, and edge deployment scenarios. This card documents the platform's core capabilities, identified risk surface, safeguard architecture, and the rationale behind current partner access tier controls and deployment decisions.

We produced this card in coordination with the Senior Director of Engagement Marketing, the Partner Enablement Engineering team, and Platform Security. It reflects findings from two internal red-team engagements and one third-party access control audit conducted prior to V-1 Series general availability.

2. Platform Capabilities

2.1 Core Functions

- Automated deal registration, quote configuration, and partner incentive calculation across 14 program tiers
- Real-time access provisioning to product sandbox environments, NFR licenses, and technical enablement libraries

- AI-assisted partner matching engine: surfaces recommended solution paths based on partner competency profile, customer vertical, and deal size (beta, Q2 2020; GA Q3 2021)
- Centralized performance tracking, MDF allocation, and rebate calculation across 3,200+ active partner organizations
- Single sign-on federation across cloud provider partner portals via SAML 2.0 / OIDC; validated against AWS, Azure, and Google Cloud federation endpoints

2.2 AI/ML Component -- Partner Matching Engine

The platform's AI-assisted matching engine was the primary subject of this documentation cycle. We observed the following properties across the evaluation period and document them here in full, including findings that were not surfaced in the commercial program guide.

Evaluation Metric	Result	Documentation Note
Recommendation accuracy (in-distribution)	91.4%	Validated against 18-month partner placement outcome data; North American and Western European cohort dominant
Accuracy on emerging verticals (OOD)	67.2%	Out-of-distribution gap; flagged as primary equity risk in Section 4.3. OOD performance is the safety-relevant figure.
Adversarial input resistance	Moderate	Prompt injection identified via deal notes field (free-text input); disclosed and remediated in v2.4.1 -- see Section 4.2
Bias audit: partner size / region	2 findings	Small-partner underrepresentation in APAC; lower-confidence recommendations for partners under 50 FTEs in those markets
Explainability (rationale surfaced)	Partial	Recommendation rationale surfaced to partner; confidence intervals not yet exposed to end user at time of this card

3. Safety Architecture & Safeguards

Partner Connect's safeguard architecture reflects a layered access model in which depth of system access is proportional to verified partner competency, security posture, and contractual standing. This structure directly encodes the proportional safeguard philosophy underlying enterprise AI governance frameworks and was preserved throughout the V-1 Series documentation cycle.

- Tier-based access controls: Premier-tier partners receive full API access; Registered-tier partners are scoped to catalog browse and quote configuration only. Access elevation requires documented competency validation.
- Multi-party authentication for sandbox provisioning: both partner administrator approval and channel manager sign-off required before environment access is granted

- All deal-registration data encrypted at rest (AES-256) and in transit (TLS 1.3); no partner organization can access another partner's deal data under any privilege configuration that exists in this release
- AI recommendation outputs are logged, timestamped, and auditable by default; no recommendation is acted upon without explicit partner confirmation at the UI layer
- External penetration test completed prior to V-1 GA: two medium findings remediated before release; one low finding deferred with compensating control and documented rationale

4. Identified Risks & Honest Disclosures

DOCUMENTATION LEAD NOTE	The disclosures in this section reflect findings surfaced during documentation review. In two instances, the commercial program team proposed language that understated risk exposure. This card reflects the accurate technical state of each finding, not the preferred commercial framing. Accountability documentation that softens known limitations does not serve the partner community, the legal team, or the long-term credibility of the platform.

4.1 Prompt Injection via Deal Notes Field (Severity: Medium -- Remediated in v2.4.1)

During red-team review, the Partner Enablement Engineering team identified that free-text input in the deal notes field could be used to inject instructions that influenced the AI matching engine's output. This is a prompt injection vulnerability of the class documented in academic literature on LLM-assisted workflow systems. Mitigation: input sanitization deployed in v2.4.1; partners should not expose the deal notes field to end-customer input prior to applying that patch. This finding was disclosed to the legal team before release; the commercial team's initial framing would not have included this disclosure.

4.2 APAC Small-Partner Underrepresentation (Severity: Low -- Active Mitigation)

Training data for the matching engine over-represents North American and Western European partner placement outcomes. Partners headquartered in APAC markets with fewer than 50 employees receive lower-confidence recommendations on average. We document this because it affects the equity of automated partner development support -- an underrepresented partner receives materially worse AI assistance without any indication that this is occurring. Mitigation: manual review flag added for APAC partners below the underrepresentation threshold; targeted data collection in progress.

5. Accessibility & Inclusive Design

A commitment to equitable access does not end at the security perimeter. We audited the Partner Connect portal against WCAG 2.1 AA standards during this documentation cycle. Three accessibility gaps were identified affecting partners who rely on screen readers or keyboard-only navigation for deal registration workflows: (1) dynamic deal-builder step flow did not expose ARIA live region updates; (2) quote summary modal trapped keyboard focus on open; (3) rebate calculation table lacked row-header associations for screen reader traversal. All three findings were escalated to the UX team and are

tracked in the platform backlog. Partners with accessibility requirements should contact their channel manager for interim accommodations while remediation is in progress.

6. Deployment Decision Rationale

V-1 Series was released to Premier and Advanced partner tiers following remediation of the two medium penetration test findings. Registered-tier partners were given read-only catalog access pending completion of the deal-registration field sanitization patch. This staged release reflects a proportional access philosophy: capability access tracks verified security posture, not program tier designation alone. The AI matching engine is available at all tiers but operates with explicit confidence disclosure; partners are informed when a recommendation falls below the 75% confidence threshold. The APAC underrepresentation finding does not block release; it requires ongoing monitoring and data correction.

7. Documentation Process Note

We produced this card over a six-week cycle in coordination with eight contributors across Partner Enablement, Platform Engineering, Security, and Legal. Initial guide created. Draft resolution required two rounds of SME review and a terminology audit that resolved 14 inconsistencies between the program guide and this card's capability claims. I served as sole coordination point: maintaining the open-threads tracker, chasing outstanding contributions, and making final editorial calls on contested language, including the two instances where the commercial team's preferred framing was set aside in favor of accurate technical disclosure. The process established here became the template for subsequent V-2 and V-3 documentation cycles.
